Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The error bars represent the standard error of the mean.

§ 2107-114 Act 2

21

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).

INTRODUCTION

The following table shows the results of the regression analysis for the dependent variable "Number of publications" (Table 1). The independent variables are "Gender", "Age", "Experience", "Education", and "Research area". The table includes the coefficient, standard error, t-statistic, and p-value for each variable.

Latent functions: carlasie pentru toate tipurile de activitati, unde poti avea direct sau indirect beneficiile, dar nu si riscurile.
